

Ingredients.

● The active ingredients used in fisiocrem are highly concentrated extracts derived from the pure herbs. When combined together these extracts have a synergistic effect on each other that increases the overall potency of the crème and enhances the therapeutic effect.

Arnica montana - commonly known as "arnica". Used for its effects as a local anti-inflammatory and an analgesic. Arnica has remarkable actions on the local circulation where it assists the re-absorption of bruising and cellular disruptions. Used for centuries in traditional medication, arnica is known and prescribed all over the world. It is the most commonly used herb in natural medicine for the treatment of any trauma.

Hypericum perforatum - known as "St Johns Wort", this plant has a traditional history of use when nerve endings have been damaged. It is extremely soothing to irritated nerves typically found in back and neck problems, or sports injuries.

Calendula officinalis - one of the oldest natural remedies, Calendula is the gentle healer. It soothes damaged and irritated tissues, increases local circulation, and plays an important role in the local stimulation of the lymphatic system to remove metabolite waste or damaged cells from the injured area.

Mentha piperita - the oil of peppermint has remarkable penetration properties. It assists the trans-dermal passage of the other actives and rapidly produces a localised cooling and analgesic effect.

Fisiocrem is the natural solution for muscle and joint pain.

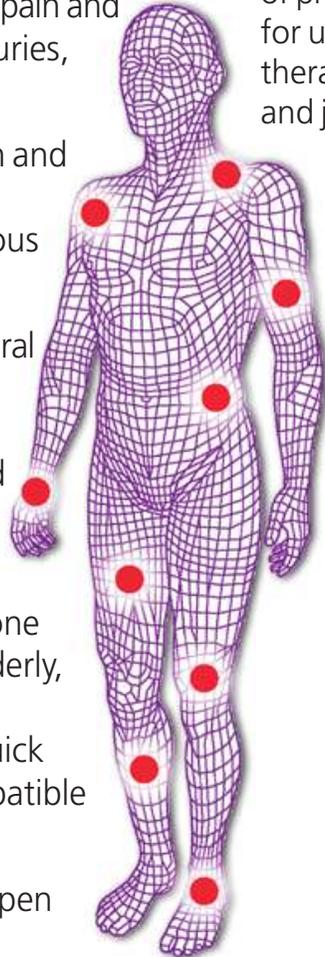

Fisiocrem quickly soothes the pain and inflammation of common injuries, bruises, sprains and strains.

Fisiocrem aids the circulation and may offer some relief for rheumatism, arthritis, or venous congestion.

Fisiocrem is a completely natural product that can be used in conjunction with pharmaceutical medicine and other physiotherapeutic treatments.

Fisiocrem is suitable for anyone to use – athletes, children, elderly, pregnant and breast feeding mothers. The easy use and quick working effects make it compatible with your everyday life.

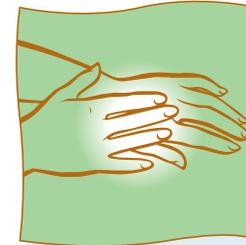

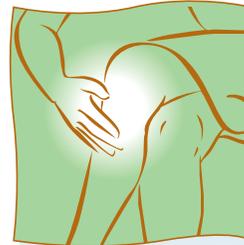

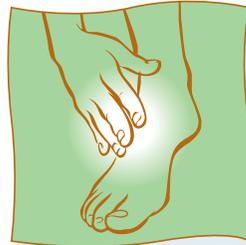

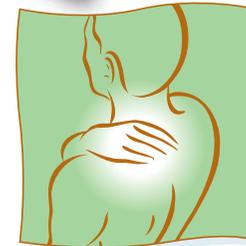

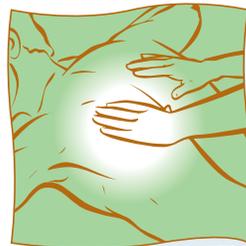

For external use only. Avoid open wounds.

Indications.

Fisiocrem is a fast working anti-inflammatory crème suitable for use during the treatment of strained muscles, bruising, sprains, tendonitis, dislocations and other injuries.

Fisiocrem is recommended for use in all types of physiotherapeutic treatment and is suitable for use during all stages of rehabilitation therapy of muscles and joints.

In case of local irritation, discontinue use.

Application.

Take a liberal amount of **Fisiocrem** and rub gently into the affected area.

Fisiocrem can be used as often as required, normally 2 or 3 applications per day.

Fisiocrem can be used before and after 'ice' treatment, or as a poultice under a support bandage for acute injuries.
